

Serial No. 09/739,478  
Docket No. NEC 00P310  
Amendment D under Rule 116

**AMENDMENTS TO THE CLAIMS:**

Please cancel claims 1-10 and 13-21, without prejudice.

This listing of claims will replace all prior versions and listings of claims in the  
Application:

**Claims 1-21 (canceled)**

**Claim 22 (previously presented):** An active-matrix liquid crystal display comprising:  
a first substrate including a pixel electrode provided for each pixel, and a driving  
element provided for each of said pixel electrodes;

a second substrate disposed opposite to said first substrate and including an opposite  
electrode; and

a liquid crystal layer sandwiched between said first substrate and said second substrate,  
wherein said pixel electrode has a generally rectangular shape, and a recess in groove shape is  
formed therein extending from one of a pair of opposite sides of said pixel electrode to the  
other to divide said pixel electrode into two parts, said recess being formed linearly with a  
constant width except that it has a smaller width in the central portion in a longitudinal  
direction.

**Claim 23 (previously presented):** An active-matrix liquid crystal display according  
to claim 22, wherein, when a voltage is applied between said pixel electrode and said opposite  
electrode, liquid crystal molecules in said liquid crystal layer are laid toward a longitudinal  
direction of said recess in accordance with magnitude of said voltage.

**Claim 24 (previously presented):** An active-matrix liquid crystal display according  
to claim 22, wherein said pixel electrode is continuously formed across said recess.

Docket No. NEC 00P310  
Amendment D under Rule 116

**Claim 25 (previously presented):** An active-matrix liquid crystal display according to claim 22, wherein a conductive layer of said pixel electrode is removed in said recess.

**Claim 26 (previously presented):** An active-matrix liquid crystal display according to claim 22, further comprising a guide in bank shape formed on said first substrate along a side of said pixel electrode in parallel with a longitudinal direction of said recess.

**Claim 27 (previously presented):** An active-matrix liquid crystal display according to claim 22, further comprising:

a polarizer; and

at least one of an optically negative compensating film and an optically positive compensating film provided between said first substrate or said second substrate and said polarizer, whereby refractive index anisotropy in a layer including said liquid crystal layer and said compensating film is made isotropic.

**Claim 28 (previously presented):** An active-matrix liquid crystal display according to claim 22, wherein said liquid crystal layer comprises a liquid crystal material with negative dielectric constant anisotropy, and liquid crystal molecules in said liquid crystal layer are aligned perpendicularly to each of said substrates when no voltage is applied between said pixel electrode and said opposite electrode.

**Claim 29 (previously presented):** An active-matrix liquid crystal display according to claim 28, further comprising quarter-wave plates provided on both sides of said liquid crystal layer, respectively, said quarterwave plates having optical axis orthogonal to each other.

**Claim 30 (previously presented):** An active-matrix liquid crystal display comprising:

a first substrate including a pixel electrode provided for each pixel, and a driving element provided for each of said pixel electrodes;

a second substrate disposed opposite to said first substrate and including an opposite electrode; and

a liquid crystal layer sandwiched between said first substrate and said second substrate, wherein said pixel electrode has a generally rectangular shape, and a recess in groove shape is formed therein extending from one of a pair of opposite sides of said pixel electrode to the other to divide said pixel electrode into two parts, said recess being formed such that its width is smaller in its central portion in a longitudinal direction of said recess and becomes gradually larger toward each of a pair of opposite sides of said pixel electrode.

**Claim 31 (previously presented):** An active-matrix liquid crystal display according to claim 30, wherein, when a voltage is applied between said pixel electrode and said opposite electrode, liquid crystal molecules in said liquid crystal layer are laid toward a longitudinal direction of said recess in accordance with the magnitude of said voltage.

**Claim 32 (previously presented):** An active-matrix liquid crystal display according to claim 30, wherein said pixel electrode is continuously formed across said recess.

**Claim 33 (previously presented):** An active-matrix liquid crystal display according to claim 30, wherein a conductive layer of said pixel electrode is removed in said recess.

**Claim 34 (previously presented):** An active-matrix liquid crystal display according to claim 30, further comprising a guide in bank shape formed on said first substrate along a side of said pixel electrode in parallel with a longitudinal direction of said recess.

**Claim 35 (previously presented):** An active-matrix liquid crystal display according to claim 30, further comprising:

a polarizer; and

at least one of an optically negative compensating film and an optically positive compensating film provided between said first substrate or said second substrate and said polarizer, whereby refractive index anisotropy in a layer including said liquid crystal layer and said compensating film is made isotropic.

**Claim 36 (previously presented):** An active-matrix liquid crystal display according to claim 30, wherein said liquid crystal layer comprises a liquid crystal material with negative dielectric constant anisotropy, and liquid crystal molecules in said liquid crystal layer are aligned perpendicularly to each of said substrates when no voltage is applied between said pixel electrode and said opposite electrode.

**Claim 37 (previously presented):** An active-matrix liquid crystal display according to claim 36, further comprising quarter-wave plates provided on both sides of said liquid crystal layer, respectively, said quarter-wave plates having optical axis orthogonal to each other.
